

Vascular Model Repository

Specifications Document

0102_H_PULM_H

Legacy Name: SU0241

Model added: 13 Jun 2022

Species	Human
Anatomy	Pulmonary
Disease	Healthy
Procedure	None

Clinical Significance and Background

Pulmonary

Pulmonary circulation involves blood flowing from the right ventricle of the heart into the pulmonary arteries. From the pulmonary arteries, the blood then reaches the lungs, performs a gas exchange, and then continues to the pulmonary veins which then lead to the left atrium of the heart.

By definition, an artery is a blood vessel that carries blood away from the heart. This usually means arteries carry oxygenated blood to the rest of the body, but since the pulmonary arteries are transporting blood from the right side of the heart to the lungs to perform respiration, that makes the pulmonary arteries the only arteries in the body that carry deoxygenated blood. Similarly, the pulmonary veins, which carry blood that has been freshly oxygenated from the lungs back to the heart, are the only veins that carry oxygenated blood.

Clinical Data

General Patient Data

Age (yrs)	7
Sex	Male

Specific Patient Data

Weight (kg)	24
Height (cm)	125
Qp (L/min)	1.9
RVEDV (ml)	63
RVESV (ml)	34

Notes

See [paper:1](#) and [paper:2](#) for more details. See below for information on the image data.

Image Modality: MR

Image Type: VTI

Image Source: Lucille Packard Children's Hospital

Publications

See the following publications which include the featured model for more details:
